## Construction 13: Book I, Proposition 45

To construct, in a given rectilineal angle, a parallelogram equal to a given rectilineal figure.

Note: This given rectilineal figure may be divided (in either of two ways) into two triangles. A polygon with more sides could also be divided into triangles. So this construction is simply an example of a general method: divide the given rectangle into triangles, as many as needed, then apply Construction \#12 repeatedly. We give this exemplary construction in outline form only.

I.45:3. Let ABCD be the given rectilineal figure, and E the given rectilineal angle;
I.45:7 Let DB be joined,

I.45:7. and let the parallelogram FH be constructed equal to the triangle ABD, in the angle HKF which is equal to E ; [I.42] (22 steps, omitted)
I.45:10. let the parallelogram GM equal to the triangle DBC be applied to the straight line GH, in the angle GHM which is equal to E. [I.44] (36 steps, omitted)

Note: HM is AB prolonged.

I.47:47. Therefore the parallelogram KFLM has been constructed equal to the given rectilineal figure ABCD , in the angle FKM which is equal to the given angle E .
Q.E.F.
